

What fertiliser and when to use?

On young trees	Use a high Nitrogen ratio to help develop strong growth and a good framework.	Additional applications of chicken manure will also be of benefit.
On fruit bearing trees	Use high potassium fertilisers to encourage a good harvest.	After harvest, apply high nitrogenous fertilisers until autumn to strengthen growth.
Dormant trees	Do not fertilise!	Wait until growth starts in late winter and early spring.
Other nutrients	Apply trace elements in spring and autumn.	Apply organic material prior to planting and in spring.
Additional Fertilising	Seaweed solution will improve plant pest and disease resistance.	Liquid fertilisers help to give plants an instant boost as they contain a mix of macro, micro and trace elements.
